

1. What is the purpose of using `document.getElementById()` in the calculator?

It's a line of code that is used by javascript to read specific element in the webpage.

2. Why do we use `Number()` before performing the calculation?

The `number()` code is used to ensure mathematical operation takes place rather it be reading as string, it also helps to make sure the operation function properly without creating any errors.

3. How do HTML, CSS, and JavaScript work together in this activity?

HTML is the structure that creates element of a calculator such as the buttons and inputs, while css is the design of the calculator making it more interactive and clean. Javascript is the behavior of the system it gives function to the buttons and that run calculation in the background.
